Now, Joint PMF of X, Y is given by

$$p_{XY}(x, y) = \begin{cases} \frac{(0.25-0.2)}{(1+0.25)} & x = 0, y = 1 \\ \frac{(0.2-0)}{(1+0.25)} & x = 1, y = 0 \\ \frac{(0.25+0.25)}{(1+0.25)} & x = 0, y = 0 \\ \frac{(1-0.2)}{(1+0.25)} & x = 1, y = 1 \end{cases} \quad (2.0.3)$$

$$= \begin{cases} 0.04 & x = 0, y = 1 \\ 0.16 & x = 1, y = 0 \\ 0.36 & x = 0, y = 0 \\ 0.64 & x = 1, y = 1 \end{cases} \quad (2.0.4)$$

Now, bit error probability for $X = 0$ is given by

$$P_{e0} = p_{Y|X=0}(1) = \frac{p_{XY}(0, 1)}{p_X(0)} \quad (2.0.5)$$

$$= \frac{0.04}{0.4} \quad (2.0.6)$$

$$= 0.01 \quad (2.0.7)$$

and, bit error probability for $X = 1$ is given by

$$P_{e1} = p_{Y|X=1}(0) = \frac{p_{XY}(1, 0)}{p_X(1)} \quad (2.0.8)$$

$$= \frac{0.16}{0.8} \quad (2.0.9)$$

$$= 0.02 \quad (2.0.10)$$

Hence, average bit error probability is given by

$$P_e = \frac{1}{2}(P_{e0} + P_{e1}) \quad (2.0.11)$$

$$= \frac{1}{2}(0.01 + 0.02) \quad (2.0.12)$$

$$= \boxed{0.015} \quad (2.0.13)$$

1 QUESTION NO. 8.2(GATE PROBABILITY)

Consider a binary digital communication system with equally likely 0's and 1's. When binary 0 is transmitted the voltage at the detector input can lie between the level $-0.25V$ and $+0.25V$ with equal probability. When binary 1 is transmitted, the voltage at the detector can have any value between 0 and 1V with equal probability. If the detector has a threshold of $0.2V$ (i.e., if the received signal is greater than $0.2V$, the bit is taken as 1), the average bit error probability is

- 1) 0.15 2) 0.2 3) 0.05 4) 0.5

2 SOLUTION

Let $X \in \{0, 1\}$ be the transmitted symbol and $Y \in \{0, 1\}$ be the detected symbol.

PMF of X is given by

$$p_X(x) = \begin{cases} \frac{(0.25+0.25)}{(1+0.25)} & x = 0 \\ \frac{(1-0)}{(1+0.25)} & x = 1 \end{cases} \quad (2.0.1)$$

$$= \begin{cases} 0.4 & x = 0 \\ 0.8 & x = 1 \end{cases} \quad (2.0.2)$$
